DELAWARE RIVER BASIN NAWQA PROJECT**

The National Water-Quality Assessment (NAWQA) Program of the U.S. Geological Survey is a long-term program with goals to describe the status and trends of water-quality conditions for a large, representative part of the Nation's ground- and surface-water resources; provide an improved understanding of the primary natural and human factors affecting these observed conditions and trends; and provide information that supports development and evaluation of management, regulatory, and monitoring decisions by other agencies.

Assessment activities are being conducted in 53 study units (major watersheds and aquifer systems) that represent a wide range of environmental settings nationwide and that account for a large percentage of the Nation's water use. A wide array of chemical constituents will be measured in ground water, surface water, streambed sediments, and fish tissues. The coordinated application of comparative hydrologic studies at a wide range of spatial and temporal scales will provide information for decision making by water-resources managers and a foundation for aggregation and comparison of findings to address water-quality issues of regional and national interest.

NAWQA study units are divided into three groups that are studied intensively on a rotational basis. Three NAWQA studies have been active in the state of Pennsylvania. The Lower Susquehanna (LSUS) study unit conducted intensive sampling from 1993 through 1995 and is currently in a low-intensity phase. The Allegheny and Monongahela River Basins (ALMN) study unit conducted intensive sampling from 1996 through 1998 and is currently in a low-intensity phase. The Delaware River Basin (DELR) study unit started intensive sampling in 1999 and will complete this phase of the study in 2001. It will then enter the low-intensity phase and is scheduled to resume intensive sampling in 2008.

Communication and coordination between USGS personnel and other local, State, and federal interests are critical components of the NAWQA Program. Each study unit has a local liaison committee consisting of representatives from key federal, State, and local water resources agencies, Indian nations, and universities in the study unit. Liaison committees typically meet semiannually to discuss their information needs, monitoring plans and progress, desired information products, and opportunities to collaborate efforts among the agencies.

Additional information about the NAWQA Program is available through the world wide web at [http://wwwrvares.er.usgs.gov/nawqa/nawqa\\_home.html](http://wwwrvares.er.usgs.gov/nawqa/nawqa_home.html).

Delaware River Basin (DELR) NAWQA fixed stations (fig. 10) are: Delaware River at Port Jervis, NY (01434000); Jordan Creek near Schnecksville, PA (01451800); Lehigh River at Glendon, PA (01454700); Delaware River at Trenton, NJ (01463500); Little Neshaminy Creek at Valley Rd. near Neshaminy, PA (01464907); Cooper River at Haddonfield, NJ (01467150); Tulpehocken Creek near Bernville, PA (01470779); (01472000); French Creek near Phoenixville, PA (01472157); Schuylkill River at Philadelphia, PA (01474500); and Raccoon Creek near Swedesboro, NJ (01477120) (Figure 10). Data from Pennsylvania fixed stations are published in the continuous-record section of this report. Additional data on bed sediment, fish tissue, fish community, and synoptic sampling sites can be found in the special-studies section of this report. A complete list of Delaware NAWQA data can be found in 'Water Resources Data, New Jersey, Water Year 1999', Water-Data Report NJ-99-3.

**Analyses of volatile organic compounds in surface-water samples (schedule 2020/2021)**

Selected surface water samples from DELR NAWQA study sites were analyzed for volatile organic compounds (VOCs) in 1999. The National Water Quality Lab (NWQL) created a method for accurate determination of VOCs in water in the nanogram per liter range, schedules 2020/2021. The method described in USGS Open-File Report 97-829 (Connor and others) is similar to USEPA method 524-2 (Mund, 1995) and the method described by Rose and Schroeder (1995). Minor improvements to instrument operating conditions include the following: additional compounds, quantitation ions that are different from those recommended in USEPA Method 524.2 because of interferences from the additional compounds, and a data reporting strategy for measuring detected compounds extrapolated at less than the lowest calibration standard or measured at less than the reporting limit. The non-detection value (NDV) is introduced as a statistically defined reporting limit designed to limit false positives and false negatives to less than 1 percent.

This table lists the volatile organic compounds on the schedule, the unit of measure (micrograms per liter ( $\mu\text{g/L}$ )), the U.S. Geological Survey National Water Information System parameter code, the Union of Pure and Applied Chemistry (IUPAC) compound name, and the National Water Quality Laboratory compound name. Positive detections measured at less than NDV are reported as estimated concentrations (E) to alert the data user to decreased confidence in accurate quantitation. Values for analytes in the 2020/2021 schedules are preceded by an "E" in the following situations:

1. When the calculated concentration is less than the lowest calibration standard. The analyte meets all identification criteria to be positively identified, but the amount detected is below where it can be reliably quantified.
2. If a sample is diluted for any reason. The method reporting level is multiplied by the dilution factor to obtain the adjusted method reporting level. Values below the lowest calibration standard, multiplied by the dilution factor are qualified with an "E". For example, a value of 0.19 in a 1:2 dilution is reported as E0.1.
3. If the set spike has recoveries out of the specified range (60-140%).
4. If the analyte is also detected in the set blank. If the value in the sample is less than five times the blank value and greater than the blank value plus the long term method detection limit, the value is preceded by an "E" to indicate that the analyte is positively identified but not positively quantified because the analyte was also detected in the blank.

**Only VOCs detected for one or more samples are listed in the water-quality tables.**

**ANALYSIS OF SAMPLES COLLECTED AT SPECIAL-STUDY SITES  
DELAWARE RIVER BASIN NAWQA PROJECT**

**SCHEDULE DESCRIPTION.**--The sample water is actively purged with helium to extract the volatile organic compounds. The volatile compounds are trapped onto a sorbent trap, thermally desorbed, separated by a megabore gas chromatographic capillary column, and finally determined by a full scan quadropole mass spectrometer. Compound identification is confirmed by the gas chromatographic retention time and by the resultant mass spectrum, typically identified by three unique ions.

**SAMPLE REQUIREMENTS.**--Water collected in vials placed in stainless steel VOC sampler. Hydrochloric acid is used for preservation. Chilled at 4°C (packed in ice).

**CONTAINER REQUIREMENTS.**--40 milliliter baked amber septum glass vial, from OCALA Quality Water Service Unit.

**PCODE.**--The EPA/USGS parameter code.

**COMPOUND NAME.**--IUPAC nomenclature.

**NDV.**--Non-detection value.

**ANALYSIS OF SAMPLES COLLECTED AT SPECIAL-STUDY SITES  
DELAWARE RIVER BASIN NAWQA PROJECT**

**STREAMBED SEDIMENTS--Continued**

**REMARKS.**--Bed-sediment data were collected at 30 surface-water sites as part of the DELR NAWQA study. Streambed sediment samples were collected during low-flow conditions in the Delaware River Basin during July and August 1998, and June-August 1999 to determine concentrations of trace elements and hydrophobic organic compounds in stream bed sediments. Sites were located throughout the Delaware River Basin in New Jersey, New York, and Pennsylvania. Bed sediment samples at each site were composites of the top 1 to 2 centimeters of material from at least 5 different depositional areas within the stream reach. A subsample from the composite sample collected at each site was processed for particle-size analysis. Additionally, subsamples from the composite were: (1) processed using a 2.0- millimeter stainless-steel mesh sieve for preparation of material for organic contaminant analysis, and (2) processed using a 63-micrometer nylon-cloth sieve for preparation of material for trace element analysis. Specific details describing the guidelines used in collecting and in processing the streambed sediment samples can be found in Shelton and Capel, 1994, Guidelines for collecting and processing samples of streambed sediment for analysis of trace elements and organic contaminants for the National Water-Quality Assessment program: U.S. Geological Survey Open-File Report 94-458, 20 p.

**CONCENTRATIONS OF TRACE ELEMENTS AND ORGANOCHLORINE COMPOUNDS IN FISH TISSUE--Continued**

Fish-tissue samples were collected at 25 surface-water sites as part of the DELR NAWQA study. The purpose of this survey was to assess the occurrence and distribution of trace metals and organochlorine compounds in fish tissue. Samples were collected from sites throughout the Delaware River Basin in New Jersey, New York, and Pennsylvania. The following species were collected: white sucker (*Catostomus commersoni*), common carp (*Cyprinus carpio*), and smallmouth bass (*Micropterus dolomieu*). More information regarding methods can be found in Crawford and Luoma, 1993, Guidelines for studies of contaminants in biological tissues for the National Water-Quality Assessment program: U.S. Geological Survey Open-File Report 92-494, 69 p.

Concentrations of trace elements in fish-liver composites, calendar years 1998 and 1999.

Each sample for trace elements analyses consisted of a composite of liver tissue from 5-10 fish. Laboratory procedures included (1) drying, (2) digestion, and (3) analysis by use of inductively coupled plasma emission spectrometry (for Al, Ba, B, Cr, Cu, Fe, Mn, Sr, and Zn), inductively coupled plasma mass spectrometry (for Sb, As, Be, Cd, CoPb, Mo, Ni Se, Ag, U, and V), and cold vapor atomic absorption (for Hg). Constituent concentrations are provided on a dry-weight (DW) basis.

**ANALYSIS OF SAMPLES COLLECTED AT SPECIAL-STUDY SITES  
DELAWARE RIVER BASIN NAWQA PROJECT**

**CONCENTRATIONS OF TRACE ELEMENTS AND ORGANOCHLORINE COMPOUNDS IN FISH TISSUE--Continued**

Concentrations of organochlorine compounds in whole fish, calendar years 1998 and 1999.

Each sample for organochlorine analyses consisted of a composite of 5-10 whole fish (4 at 1 site). Laboratory procedures included (1) homogenization, (2) extraction by use of methylene chloride in a soxhlet apparatus, (3) clean-up by use of gel permeation chromatography, (4) fractionation by use of alumina/silica gel, and (5) analysis by gas chromatography with two dissimilar capillary columns coupled with an electron capture detector. Constituent concentrations are provided on a wet weight (WW) basis. Constituent concentrations are provided on a wet-weight (WW) basis. Constituent names are abbreviated as follows: DDD, dichlorodiphenyldichloroethane; DDE, dichlorodiphenyldichloroethene; DCPA, dimethyl tetrachloroterephthalate; DDT, dichlorodiphenyltrichloroethane; HCH, hexachlorocyclohexane; PCB, polychlorinated biphenyls.

**ANALYSIS OF SAMPLES COLLECTED AT SPECIAL-STUDY SITES  
DELAWARE RIVER BASIN NAWQA PROJECT**

**CONCENTRATIONS OF TRACE ELEMENTS AND ORGANOCHLORINE COMPOUNDS IN FISH TISSUE--Continued**

Concentrations of organochlorine compounds in smallmouth bass fillets, calendar year 1998.

Each sample for organochlorine analyses consisted of a composite of fillets with skin on from 4-5 fish. Laboratory procedures included (1) homogenization, (2) extraction by use of methylene chloride in a soxhlet apparatus, (3) clean-up by use of gel permeation chromatography, (4) fractionation by use of alumina/silica gel, and (5) analysis by gas chromatography with two dissimilar capillary columns coupled with an electron capture detector. Constituent concentrations are provided on a wet weight (WW) basis. Constituent concentrations are provided on a wet-weight (WW) basis. Constituent names are abbreviated as follows: DDD, dichlorodiphenyldichloroethane; DDE, dichlorodiphenyldichloroethene; DCPA, dimethyl tetrachloroterephthalate; DDT, dichlorodiphenyltrichloroethane; HCH, hexachlorocyclohexane; PCB, polychlorinated biphenyls.

**ANALYSIS OF SAMPLES COLLECTED AT SPECIAL-STUDY SITES  
DELAWARE RIVER BASIN NAWQA PROJECT**

**FISH COLLECTION RESULTS--Continued**

Fish-community surveys were conducted at 6 stream sites in the Delaware River basin during 1999. Sites were located in New Jersey and Pennsylvania. Fish were collected by electrofishing with pulsed-DC current in a representative 157 to 300 meter long reach at each stream site. Two electrofishing passes were conducted at each reach, except for stations 01440000 and 01464907, at which one pass was conducted. Kick seining was done briefly in riffles after completion of electrofishing. One-quarter inch mesh was used for the kick seine and the dip nets. Fish were identified, measured, weighed, and checked for anomalies such as parasites, lesions, and skeletal deformities. Most individuals were returned to the stream after processing. More details regarding collection methods can be found in Meador and others, 1993, Methods for sampling fish communities as part of the National Water-Quality Assessment program: U.S. Geological Survey Open-File Report 93-104, 40 p. Additional surface-water and/or water-quality data for these sites can be found in the continuous record station section of this report. Contact the New Jersey District Office of the U.S. Geological Survey for additional information. Family names are in uppercase, scientific names are in italics, and common names follow. Minimum and maximum total lengths (in mm) are in parenthesis below abundance.

**SURFACE WATER SYNOPTIC SURVEY--Continued**  
**May 3-18, and August 30 - September 15, 1999**

Water quality data presented in this table were collected by the Delaware River Basin National Water Quality Assessment Program (NAWQA) as part of two basin-wide synoptic surveys of nutrients, pesticides, major ions, and organic carbon; the first survey was May 3-18, 1999, and the second was August 30-September 15, 1999. Data were collected at 24 sites as part of this synoptic. Data from Pennsylvania stations are published in this report. A complete list of Delaware NAWQA data can be found in 'Water Resources Data, New Jersey', Water-Data Report NJ-99-3. Data for one sample at station 01432000, Wallenpaupack Creek at Wilsonville, PA, were collected on June 17, 1999. Selected samples were analyzed for pesticides on schedule 2001 (listed with minimum reporting levels on page 431); only pesticides identified by the analyses in one or more samples are listed in the water-quality tables. Fish tissue, bed sediment, and fish community data for some of these sites are presented on pages 433-471.
